1A(0) FRASE I BOOK EXPLANATION SOV/1786  
Akademiya nauk SSSR. Institut metallurgii  
Sovremennyye problemy metallurgii (Modern Problems in Metallurgy)  
Moscow, Izd-vo AN SSSR, 1958. 640 p. 3,000 copies printed.

Reep. Ed.: A.M. Smurnin, Corresponding Member, USSR Academy of  
Sciences; Eds. of Publishing House: V.S. Ishvarnikov, and  
A.N. Bernov; Spok. Ed.: T.V. Polyakova.

FRONTIS: This book is intended for scientists and technical per-  
sonnel in the field of metallurgy.

CONTENTS: This is a collection of articles on certain aspects of  
Soviet metallurgy. The book is dedicated to Academician  
Yuan Pilyavich and his 75th birthday. The  
book is divided into seven sections. The first section  
contains two articles presenting a brief account of the biography and  
professional activity of the Soviet metallurgist. It includes an  
article by V.I. Chelomo, Machine Guard, and Yury Mikhlin (M.C.S.S.  
USA) describing their meeting with Bardin in Moscow and also his  
visit to the United States. The second part consists of three  
articles and deals with raw materials and fuels for the Soviet  
metallurgical industry. The third part represents the major  
portion of the book. It consists of 25 articles dealing with  
the various aspects of the metallurgy of pig iron and steel.  
The fourth part consists of two articles treating the metall-  
urgy of nonferrous metals. The fifth part consists of three  
articles on the firing of metals. The sixth part consists of  
eight articles discussing certain aspects of physical metall-  
urgy. The last part deals with general problems in the field  
of metallurgy. References are given after each article. No  
abbreviations are mentioned.

## TITLE:

III Stereochemistry of Nitrogen Heterocycles (III. Stereokhimiya  
azotistyykh geterotsiklov). III. Stereoisomers of  
2-Methyl-4-ketodecahydroquinoline (III. Stereoizomeriya  
2-metil-4-ketodekagidrokhinolina)

## PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1112-1122  
(USSR)

## ABSTRACT:

Upon suggestion of the late Academician I. N. Nazarov, the authors chose in continuation of their previous papers (Refs 1, 2) the easily accessible 2-methyl-4-ketodecahydroquinoline (I) as subject of stereochemical investigations, which is synthesized from the acetylene derivatives (Ref 3) according to scheme 1. It has three asymmetric carbon atoms and can theoretically occur in the form of four racemates. From among the four possible racemates the racemates (II), (III) and (IV), denoted in scheme 2 ( $\alpha$ -,  $\beta$ -, and  $\beta'$ -isomer, were obtained. The fourth one, the  $\delta$ -isomer (V) could only be obtained in the form

Card 1/3

## III. Stereochemistry of Nitrogen Heterocycles.

SOV/79-29-4-15/77

## III. Stereoisomers of 2-Methyl-4-ketodecahydroquinoline

of its benzoyl derivatives (Va) (for details see table). On repeated fractional recrystallization of the hydrogen chloride salts (I) from anhydrous alcohol the compounds (VII) and (VIII) resulted. The results of the investigation indicate that the initial mixture of the isomers of 2-methyl-4-ketodecahydroquinoline (I) consists chiefly of the stable  $\alpha$ - and  $\gamma$ -isomers (II and IV) and partly of the less stable  $\beta$ -isomer (III). The very unstable  $\delta$ -isomer (V) in the mixture apparently does not occur. For the time being it is not possible to solve the problem whether on the closure of the piperidine ring (see the scheme) immediately the more stable  $\alpha$ - and  $\gamma$ -isomers (II) and (IV) or, at first, the less stable  $\beta$  and  $\delta$  isomers (III) and (V) are formed on the double bond of the cyclohexane ring. The  $\delta$ -isomer (V) is rapidly transformed into the  $\gamma$ -isomer (IV); the  $\alpha$ - and  $\beta$ -isomers undergo mutual transformations by way of the hydrochloride into which compound (I) must be converted in order to separate it from neutral compounds. Thus, the conditions for the mutual transformations of stable isomers into unstable ones, and vice versa, are found.

VIII. Benzoic Esters of 2-Methyl-4-Hydroxydecahydro-  
quinoline and 1,2-Dimethyl-4-hydroxydecahydroquinoline  
Isomers. New Anesthetics

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 3,  
pp 831-838 (USSR)

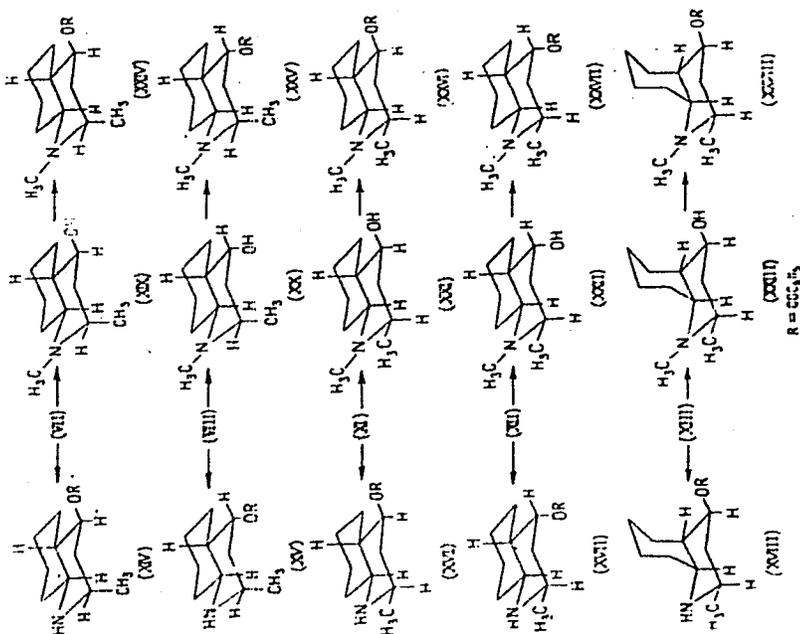

ABSTRACT: This article is a continuation of previous work (Zhurnal  
obshchey khimii, 29, 3204 (1959); Ibid, 29, 3555 (1959))  
and is devoted to synthesis of benzoic esters of the  
five common alcohols (VII, mp 134°; VIII, mp 128°;  
XI, mp 144°; XII, mp 158°) with rings joined trans,  
and alcohol (XIII, mp 115°) with rings joined cis, as  
well as benzoic esters of these alcohols with methyl  
radicals at the nitrogen (scheme 2)

SOV/79-30-3-20/69

Heating the hydrochlorides of racemic alcohols (VII), (VIII), (XI), and (XII) with benzoyl chloride results in good yield of benzoic esters of 2-methyl-4-hydroxy-decahydroquinoline, (XIV), (XV), (XVI), and (XVII). Benzoic ester (XVIII) was obtained from N-benzoyl derivatives of alcohol (XIII) by the method described previously (above ref). The properties of the obtained esters are shown in Table 3. Heating the same alcohols with a mixture of formaldehyde and formic acid yields (90%) five corresponding racemates of 1,2-dimethyl-4-hydroxydecahydroquinoline, (XIX), (XX), (XXI), (XXII), and (XXIII). The properties of the obtained compounds are shown in Table 2. Compounds were converted into corresponding benzoic esters, (XXIV), (XXV), (XXVI),

SOV/79-30-3-20/69

(XXVII) and (XXVIII). They are shown in Table 4. The majority of the synthesized compounds have strong anesthetic properties surpassing that of novocain, and especially cocain; some of them were comparable to dicain. The obtained compounds were tested at the Alma-Ata Medical Institute (chair of pharmacology) and at the Institute of Physiology of the Academy of Sciences of the Kazakh SSR (pharmacology laboratory), under the direction of I. I. Sivertsev. There are 4 tables; and 8 Soviet references.

TITLE: Infrared and ultraviolet spectra of several batch alcohols

CITED SOURCE: Tr. Komis. po spektroskopii. AN SSSR, vyp. 1, 1964, 330-336

TOPIC TAGS: spectroscopy, ir spectra, ultraviolet spectra, batch alcohol

TRANSLATION: The equilibrium constants for monomers and associates were determined by measuring the intensities of bands of free and bonded hydroxyls in the infrared absorption spectra of solutions of stereoisomer batch alcohols. It was found that for equal conditions the larger equilibrium constants correspond to associates of equatorial isomers, rather than to associates of their axial epimers. The energies of hydrogen bonds, formed by various stereoisomers and corresponding to steric coefficients, were determined from temperature relations of equilibrium constants. It is explained that equatorial isomers form stronger hydrogen bonds than axial isomers. A test to interpret the observed effects was made by obtaining data on the electronic spectra of stereoisomer alcohols in the near and vacuum ultraviolet

TITLE: Giprostal's Contribution in the Introduction of New Technology

PERIODICAL: Metallurg, 1960, No. 6, pp. 6-7

TEXT: Giprostal' workers are occupied with the following problems connected with the development of Soviet metallurgy: Industrial methods of cast-iron desulfurization which is conducted not in blast furnaces but in the ladle by lime blast. Raising the blast heat, requiring improved refractories, more powerful burners, and extended surfaces of the air-blast; high-alumina ribbed bricks will be produced at the Semiluk plant increasing the heat surface by 10-12%, without changing the volume. Supply of natural gas to blast furnaces to reduce coke consumption. Developing large-capacity open-hearth furnaces (800 tons) with a number of special features and an efficiency raised by 19%; fuel consumption reduced by 8% and refractory consumption by 23%; designing a unit for the preliminary oxygen blowing through cast iron and addition of ore and limestone, to be built at "Azovstal'". Development of standard mechanized systems for the cold repair of open-hearth furnaces. Developing of self-carburization of natural gas, tested at the plant imeni Il'yich. Devising a

Card 1/2

Giprostal's Contribution in the Introduction of New Technology

shot-blasting device for cleaning sheets at the Alchevsk plant. Developing an installation for hardfacing stainless steel sheets. This installation is equipped with various new mechanisms including a pneumatic suction device for sheets, a furnace with a roller hearth, a tilter, a hard-facing bath etc. The design of a butt-welding machine on a 350-2 mill was accomplished for the Makeyevka plant. The Institute brought about a project for an automatic pipe casting line including machines for centrifugal casting, a machine for the manufacture of molds, etc. Syphon casting of pipes is a new method which is being developed at the Institute. Besides the enumerated subjects, Giprostal' is occupied with the development of a four-groove continuous steel casting installation; the design of a multi-groove machine with tilting the blank into horizontal position is being planned. Important experimental work is performed on evaporation cooling of metallurgical units. At present over 200 open-hearth. 5 blast and 12 heating furnaces have been converted to evaporation cooling. The conversion of the majority of open-hearth furnaces, a number of blast furnaces and over 200 heating furnaces to this method is intended. Great attention is devoted to problems of mechanization and automation of ferrous metallurgical processes and to the improvement of designs metallurgical machines. ✓

AUTHORS: Lytvynenko, H.V., and Radchenko, I.V.  
TITLE: Thermal conductivity of aqueous solutions of electrolytes as a structural-sensitive property  
PERIODICAL: Ukrayins'kyy fizychnyy zhurnal, v. 7, no. 5, 1962, 539 - 547

TEXT: The apparent molal thermal conductivity of an infinitely diluted electrolytic solution is considered. The relation between the thermal conductivity of aqueous electrolytic solutions and the ionic radius is discussed from the point of view of the structure of the solution. The concept of apparent molal thermal conductivity  $\varphi_2$  was introduced by A.F. Kapustinskiy and I.I. Ruzavin (Ref. 10: ZhFKh, 30, 548, 1956). The formula for  $\varphi_2$ , proposed in Ref. 10, is however inadequate, since its principal term is not related to the thermal conductivity. The authors propose a new formula for  $\varphi_2$ , which is free of the above shortcoming. They used, for the coefficient of thermal conductivity  $\lambda_r$ , the equation

Card 1/3 .

Thermal conductivity of aqueous ...

S/185/62/007/005/009/013  
D407/D301

$$\lambda_r = \frac{\lambda}{\lambda_0} = 1 + A\sqrt{m} + Bm \quad (15)$$

proposed by G. Jones and M. Dole (Ref. 15: J. Amer. Chem. Soc., 51, 2950, 1929) for the coefficient of viscosity of electrolytic solutions of low concentration. The coefficients A and B are calculated by means of graphs; B describes the interaction of ions with the molecules of the solvent. It is related to the term  $\Lambda^0$ , entering the formula for the apparent molal thermal conductivity. The quantities B and  $\Lambda^0$  turned out to be additive with respect to the ions; hence it was possible to calculate these quantities for each ion. The calculations were based on the Cs-I scale, proposed in the references. The results of the calculation are listed in a table. By considering the dependence of  $\Lambda^0$  and B on the aqua- and radius  $r_{aq}$ , the following conclusions were reached: 1) The ions which are larger than the water molecules, have large negative  $\Lambda^0$  and B, i.e. they reduce the thermal conductivity of the solution; this reduction is the greater, the larger their radius  $r_{aq}$ . 2) Ions which are equal to, or smaller than, water molecules, have positive or small negative

Card 2/3

Thermal conductivity of aqueous ...

S/185/62/007/005/009/013  
D407/D301

values of  $\Lambda^{\circ}$  and B. 3) Multi-charge ions with small  $r_{aq}$  have large negative values of  $\Lambda^{\circ}$  and B. A comparison of the obtained results with the other properties of ions, shows that all negatively-hydrated ions reduce the thermal conductivity of the solution. By considering the influence of negatively-hydrated ions on the structure of the solution and on the translational motion of its molecules, the authors conclude that the thermal conductivity of aqueous electrolytic solutions is (unlike the viscosity) more sensitive to structural changes in the solution, than to changes in the translational motion. There are 6 figures, 3 tables and 19 references: 10 Soviet-bloc and 9 non-Soviet-bloc.

Title : Direct Measurement of the Total Light of Rapidly Decaying Processes of Luminescence.

Orig Pub : Zh. eksperim. i teor. fiziki, 1955, 29, No 4, 507-515.

Abstract : A new objective method is proposed for direct measurement of the area under the curve of fluorescent rise ( $L_r$ ) and under the curve of luminescent decay ( $L_d$ ), based on a synchronous detection of the relaxation curves and subsequent integration of these curves by means of a pointer instrument. The ratio  $L_r/L_d$  can serve as a criterion for the choice of the particular phosphorescence theory, since different theories predict, generally speaking, different values of  $L_r/L_d$ . According to the theory based on the bimolecular glow mechanism,  $L_r/L_d \leq 3$ . Measurements

made by the authors have shown that  $L_r/L_d$  can be greater than 10 (ZnS. Cu, copper concentration 1%,  $t > 60^\circ C$ ). The authors give a diagram of an instrument for measuring  $L_r$  and  $L_d$  ("L-meter"), which makes it possible to study the relaxation processes that take place in a time interval from  $10^{-1}$  to  $10^{-5}$  seconds.

**TEXT:** The results of deep geophysical sounding work in the USSR's  
northern part are stated. The aim of the work was the detailed  
study of the inner structure of the crust in the Ukhta-Kem' area.  
The work was executed along a profile with a length of ~200 km by  
the method of continuous set-ups: The seismographs were placed  
every 100 m from each other within the general instrumental set-up  
and during its movement along the traverse. Explosions were made  
in three lakes which were situated at a distance of 50 - 80 km

Card 1/2

D228/D302

from each other. Six branches of refracted seismic waves which are compared with six discontinuity surfaces of the inner crustal layers, were recorded. The boundaries -- at a depth of 10 - 15 and 34 - 38 km -- are most clearly and positively distinguished. The second boundary is the Mohorovicic surface. In the overlying layer the speed of the refracted seismic waves is 6.6 km/sec; in the underlying layer it is 8.1 km/sec. In the layer directly overlying the first boundary this velocity differs in different parts of the traverse and fluctuates within the limits of 5.4 - 6.3 km/sec. Other discontinuity surfaces and intermediate layers, characterized by speed values of 6.9 - 7.0 and 6.7 km/sec, are less clearly exposed. The layer boundaries lie almost horizontally, forming a small subterranean relief in separate parts of the profile. Geologic irregularities in the crust's upper parts were also successfully outlined in a horizontal direction along the working traverse, and a number of abyssal faults confined to the contact zones of different structural-facies geologic formations were successfully defined. TITLE:

On the Dissolution Kinetics of Nitrogen Oxides in Aqueous Solutions of Nitric Acid (Kinetika rastvoreniya okislov azota v vodnykh rastvorakh azotnoy kisloty)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1998, Nr 4, PP 71 - 76 (USSR)

ABSTRACT:

The interaction of gaseous nitrogen oxides with the solutions mentioned in the title is a complex physico-chemical process. Its single stages are recalled. The total reaction of the formation of nitric acid can be represented as follows:

The data in publications (Refs 1 - 11) on the velocity of the dissolution mentioned in the title are contradicting. There are great differences between the values of the velocity constants. In this paper the problem mentioned in the title is investigated as the first of the series of subsequent reactions in the formation of nitric acid. The investigations are to be continued. In the experimental part the apparatus used

Card 1/4

On the Dissolution Kinetics of Nitrogen Oxides in  
Aqueous Solutions of Nitric Acid

SOV/153-58-4-12/22

is described and shown (Figure). Tables 1 and 2 give the dissolution velocities of  $\text{NO}_2$  in aqueous  $\text{HNO}_3$  solutions at a linear velocity of the gas of 0.2 m/sec. or 0.4 m/sec. As may be seen from the data given the dissolved gas amount is directly proportional to the  $\text{NO}_2$  concentration in the gas. The total gas dissolution in the case of one and the same time of stay within the range of the mentioned  $\text{NO}_2$  content in the gas is independent of the  $\text{NO}_2$  concentration. The values K-velocity constant of the  $\text{NO}_2$  dissolution in cm/sec. (Tables 1 and 2) are about the same for all three heights of the apparatus. From the consideration of the data of the tables 1 and 2 it may be seen that the constants K increase with the decreasing temperature and with the increasing acid concentration. On the average the dissolution velocity increases to the double with the decrease in temperature from +30 to -10°. Therefore the  $\text{HNO}_3$  formation at increased temperatures

Card. 2/4

On the Dissolution Kinetics of Nitrogen Oxides in  
Aqueous Solutions of Nitric Acid

SOV/153-58-4-12/22

is controlled by the dissolution velocity of  $\text{NO}_2$  in water. The  $\text{HNO}_3$  accumulation in the solution hinders the absorption of the nitrogen oxides. At lower temperatures the transformation velocity of the nitrogen oxides in nitric acid should be investigated if under those conditions the process is not controlled by the  $\text{NO}_2$  dissolution but by other reactions. This problem will be dealt with in an other paper. There are 1 figure, 2 tables, and 14 references, 8 of which are Soviet.

TITLE: Film-type autoclave for the production of concentrated nitric acid

SOURCE: Khimicheskaya promyshlennost', no. 7, 1966, 38-40

TOPIC TAGS: nitric acid, nitrogen compound, chemical engineering, chemical reactor,  
chemical plant equipment

ABSTRACT: A film-type autoclave (liquid reagents flow over the packing in form of a film) packed with aluminum coil coated with a fluorinated resin for production of concentrated nitric acid is described and its advantages over the conventional flooded-type autoclave are pointed out. The schematic of the autoclave is shown in figure 1. 98.4% nitric acid was obtained in this film-type autoclave at 25 atm,  $N_2O_4:H_2O$  ratio of 8.5-8.9, and a contact time of 17 min. At 40 atm and  $N_2O_4:H_2O = 8.1-8.7$  and 17 min contact time, the acid concentration was equal to 98.7-99.2%. The oxygen consumption was close to the stoichiometric amount. It was found that the film-type autoclave is twice as effective as the flooded-type autoclave and that it compared very favorably from the standpoint of corrosion. Orig. art. has: 4 figures, 2 formulas.

TITLE: Deep geophysical investigations on the territory of the Baltic Shield

SOURCE: International Geological Congress, 21st. Copenhagen, 1960. Doklady sovetskikh geologov, problema 2: Geologicheskiye rezul'taty prikladnoy geokhimii i geofiziki. Razdel II: Geofizika. Glubinnoye stroyeniye zemli po geofizicheskim dannym, 43-50

TEXT: This is an account of deep geophysical research carried out over part of the Baltic Shield in 1958, by the "Spetsgeofizika" Office and the Vsesoyuznyy nauchno-issledovatel'skiy geologicheskiy institut (All-Union Scientific Research Institute of Geology). The method of deep seismic probes evolved under the guidance of Academician G.A. Gamburtsev was used to cover a latitudinal 200-km profile across the northern part of Karelia. With comparatively small charges clear recordings of the basic groups of waves were obtained. The waves were considerably more varied and richer in dynamic characteristics than on the Russian Platform. The use of combined systems  
Card 1/2

Deep geophysical investigations ...

S/630/60/000/002/002/006  
D055/D114

of contrary and parallel hodographs from four shot-points, facilitated the tracking of various groups of waves corresponding to the different boundaries of separation in the Earth's crust. Seismic probes facilitated a detailed study of the upper parts of the profile of pre-Cambrian crystalline strata. With the use of non-lengthwise profiles, not only was a section of the Earth's crust along the line Kem'-Ukhta obtained, but also an idea of the position of the Mohorovičić discontinuity. Nevertheless, the cost of the deep seismic investigations was no greater than that of ordinary seismic oil-prospecting. The results obtained, facilitated the division of the crust according to its elastic properties, into several layers in the particular area of the Baltic Shield. The boundary at a depth of 10-15 km is most clearly marked, and this is related to the basalt surface. The boundary at 30-38 km is related to the Mohorovičić discontinuity. The geological interpretation of all deep boundaries of division at the given stage of research is not yet sufficiently clear. Apart from their relevance to the Baltic Shield, these investigations admit a more critical evaluation of the results of similar work in regions covered by a sedimentary top. There is reference to the work carried out by F. Berch on granite. There are 3 figures.

TITLE: Deep seismic sounding in the territory of the Baltic shield

PERIODICAL: Referativnyy zhurnal. Geofizika, no. 9, 1961, 5-6, abstract 9A36 (V sb. Seysmich. issled. no. 4, M., AN SSSR, 1960, 47-54)

TEXT: Deep seismic sounding was carried out in 1958 in the territory of Kareliya along the Kem'-Ukhta road. Certain side (forest) roads were used in addition to the main road. The small profile distortion was not reflected in the quality of the results of the work. The operative area is formed of ancient, highly metamorphozed rocks of a variable composition. The profile's eastern part is confined to the region where the oldest Archean fold structures (of the Belomorides) are developed, and the western part intersects the younger Kareliyan folding. Observations were made from four explosion points 50 - 80 km apart from each other; the

Card 1/3

S/169/61/000/009/003/056  
D228/D304

## Deep seismic sounding...

distance between the seismic detectors was equal to 100 m. Deep seismic sounding was conducted in conjunction with other geophysical observations (magnetometry, gravimetry). In addition, parametric soundings with a length of 200 - 300 m were undertaken at a number of exposures in order to study the uppermost part of the section of crystalline rocks in greater detail. The hodographs of six main wave-groups (I, II, III, IV, V, and M) were obtained through the preliminary processing of the results. The clearest boundaries of velocity variation at which reflected and leading waves arise are as follows: horizon III,  $V_g = 6600$  m/sec, depth 10 - 15 km; horizon M (the Mohorovicic boundary),  $V_g = 8100$  m/sec, depth 34 - 38 km. Boundary III is evidently connected with the surface of the "basalt" layer. Horizon II ( $V_g = 6400$  m/sec) is distinguished with less authenticity at a depth of about 5 km. This horizon is traced well only in the 100 - 140 km section of the Kem'-Ukhta profile--in the region where the zone of the East Kareliyan synclinal-structure is developed. Seismic boundaries IV and V, recorded in the "basalt" layer, still need to be made more precise; the velocity change at these boundaries is small. The

Card 2/3

Deep seismic sounding...

S/169/61/000/009/003/058  
D228/D304

general rise of the Mohorovicic surface is outlined in a northeasterly direction to the side of the spacious region of Belomoride development. On the whole, the crust evidently has a smaller thickness in the area where the White Sea fold-structure is developed. Apart from the crust's horizontal layering, the data of the deep and parametric seismic-sounding permit the establishment of vertical zones of tectonic dislocations and contacts between rocks of a different composition. Abrupt variations in the recording intensity, the strong absorption of elastic vibrations, breaks in the correlation, etc. are noted in the zones of tectonic dislocation. The zone of abyssal fractures--approximately in the middle of the studied profile--is most authentically established. In the geologic respect this zone is characterized by the articulation of the Belomorides with the Karelides and by the development of grandiorite intrusions with a clearly-oriented drainage system. TITLE: Detector for determining the thermal conductivity of liquids by the method of heating a filament under nonstationary thermal conditions. Class 42, No. 172519

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 13, 1965, 77

TOPIC TAGS: thermal conductivity, fluid

ABSTRACT: This Author Certificate presents a detector for determining the thermal conductivity of liquids by the method of heating a filament under nonstationary thermal conditions. The detector consists of a thin wire-heater which at the same time serves as a resistance thermometer (see Fig. 1 on the Enclosure). To obtain the possibility for producing measurements of the thermal conductivity of conducting liquids without a significant increase in detector thickness, the detector is made of a microwire in glass insulation. SOURCE: <sup>10 16</sup> Pribory i tekhnika eksperimenta, no. 5, 1965, 252-253

TOPIC TAGS: glass coating, microwire, welding technology, welding

ABSTRACT: This note describes a new method for welding the end of a glass-coated copper microwire to a glass-coated thicker platinum wire. The welding proceeds under the glass layer and the weld proper remains reliably isolated by a continuous glass layer. The proposed method has been used successfully in the construction of a sensor for heat conduction determination in current conducting liquids using the nonstationary heated filament method. The microwire used was 20 and 12  $\mu$  in diameter (resistivity of 70 and 200 ohm/m, respectively) and had coatings 10 and 4  $\mu$  thick. Orig. art. has: 3 figures.

TITLE: Earth crust structural features of the eastern part of the Baltic shield

23  
B

SOURCE: Ref. zh. Geofizika, Abs. 10G5

REF SOURCE: Sb. Geol. rezul'taty prikl. geofiz. Geofiz. issled. stroyeniya zemn. kory. M., Nedra, 1965, 70-74

TOPIC TAGS: earth crust, earth crust structure, seismic prospecting, seismic prospecting data

ABSTRACT: Results of seismic soundings in depth, conducted in the Northern Karelia and on the Kola peninsula along two profiles are given and conclusions regarding the structure of the ancient shields presented. The basic depth of the crust shows layers of different elasticities. The structure is complicated and defies description by the simple concepts of "granite" or "basaltic" layers. The upper part of the "granite" layers on the ancient shelf is exposed. A block pattern of earth crust structure is present and particularly noticeable in the upper layers, down to a 5 - 3 km depth. Seismic boundaries at depth may have been due to a prolonged rise and subsequent erosion of the shield. Zones of breaks at depth are found throughout the crust depth, usually at the butts of the structure-facial zones. [Translation].

TITLE: Crustal <sup>12</sup>structure of the eastern Baltic shield

SOURCE: International Geological Congress. 22d, New Delhi, 1964. Geologicheskiye rezul'taty prikladnoy geofiziki (Geological results of applied geophysics); doklady sovetskikh geologov, problema 2. Moscow, Izd-vo Nedra, 1965, 70-74

TOPIC TAGS: seismic sounding, elastic property, metamorphosed rock, ~~crustal block~~, seismology, Earth crust, STRATIGRAPHY, SEISMIC PROSPECTING / KOLA PENINSULA

ABSTRACT: Results of deep seismic sounding and other geophysical investigations conducted in the northwestern Kola Peninsula and in northern Karelia revealed that the crust consists of several layers, with different elastic properties and broken into blocks. The crustal section of the shield differs from that of the Russian platform and the Barents Sea. Most of the crustal shield is composed of the basalt layer. The granite layer is reduced in thickness and may be absent in some regions. The Pechenga series is closely associated with the basalt layer. Zones of different structure and facies have different velocity sections. The petrological composition varies within the basalt layer. In some zones the basalt layer appears to consist of gabbro-diorite types of rocks, while in others it consists of highly metamorphosed

Card 1/2

ACC NR: AT6028371

rocks such as charnockite. Seismological investigations suggest the presence of deep-seated fault zones separating crustal blocks with different geological histories. Methods of studying the block structure of the crust are not yet sufficiently well developed, though this problem is not less important than the problem of the crustal vertical layering. The terms "basalt" and "granite" do not define the entire multi-form composition of the layers. The Baltic shield where the basalt layer is fairly shallow appears to be an area quite favorable for such studies.

TITLE: Chlorophyll biosynthesis in red and near infrared regions

SOURCE: IN SSSR, Doklady, v. 160, no. 6, 1965, 1427-1429

TOPIC TAGS: corn, chlorophyll, biosynthesis, monochromatic light, red light, low intensity, chromatography, spectrophotometry

ABSTRACT: Chlorophyll biosynthesis was investigated in etiolated corn sprouts under conditions of red light (660 millimicrons) and near infrared light (770 millimicrons) of low intensities. The sprouts were exposed to a monochromatic light with an intensity of 40 micron watts/cm<sup>2</sup> for the red light and 33 micron watts/cm<sup>2</sup> for the near infrared light for periods of 1 to 60 min. All operations on the etiolated plants were conducted in the presence of a very weak green light to safeguard chlorophyll biosynthesis. Green pigments were determined in the etiolated plants before and after light exposure by paper chromatography followed by spectrophotometry on an SF-4 in the 600-700 millimicron region. Results indicate that near

Card 1/2

L 39434-65

ACCESSION NR: AP5007667

infrared radiation displays an inhibiting effect on chlorophyll biosynthesis, particularly on reduction of protochlorophyllide into chlorophyllide. Chlorophyll formation in the etiolated corn sprouts under the given experimental conditions proceeded according to the generally accepted plan for the final stage of chlorophyll biosynthesis: protochlorophyllide to chlorophyllide a to chlorophyll a. It was established that chlorophyll biosynthesis proceeds normally under red light of low intensity, but is inhibited under near infrared light of low intensity. Orig. art. has: 4 figures.
